

# IS HIGH ANKLE-BRACHIAL INDEX PREDICTOR OF INCREASED CARDIOVASCULAR RISK? THE CZECH POST-MONICA STUDY

*P. Wohlfahrt, M. Ingrischová, A. Krajčoviechová, M. Dolejšová\*, J., Seidlerová\*,  
M. Galovcová, J. Bruthans, V. Adámková, M. Jozífová, J. Filipovský\*, R. Cífková*

**Institute for Clinical and Experimental Medicine, Prague, Czech Republic**

**\* Charles University Medical School, Pilsen, Czech Republic**

# Ankle brachial index

**ABI** - the ratio of ankle pressure to brachial pressure

$\leq 0.9$  peripheral arterial disease  
 $0.9-1.3$  normal  
 $\geq 1.4$  medial arterial calcification

ABI  $\leq 0.9$

- 79–95% sensitivity and
  - 96–100% specificity
- in establishing PAD in lower extremities

# Atherosclerosis vs. Medial arterial calcification (MAC)

## Atherosclerosis

- starts in the intima layer
- lipid accumulation
- inflammation
- arterial occlusion

## MAC (Monckeberg's sclerosis)

- localised in arterial media and internal elastic membrane of muscular arteries
- calcium accumulation
- noninflammatory
- increases arterial stiffness of muscular arteries
- does not cause luminal narrowing

**(a) Mortality (all cause)**

**(b) Mortality (cardio vascular and cerebrovascular)**

**(c): Fatal and non-fatal CHD**

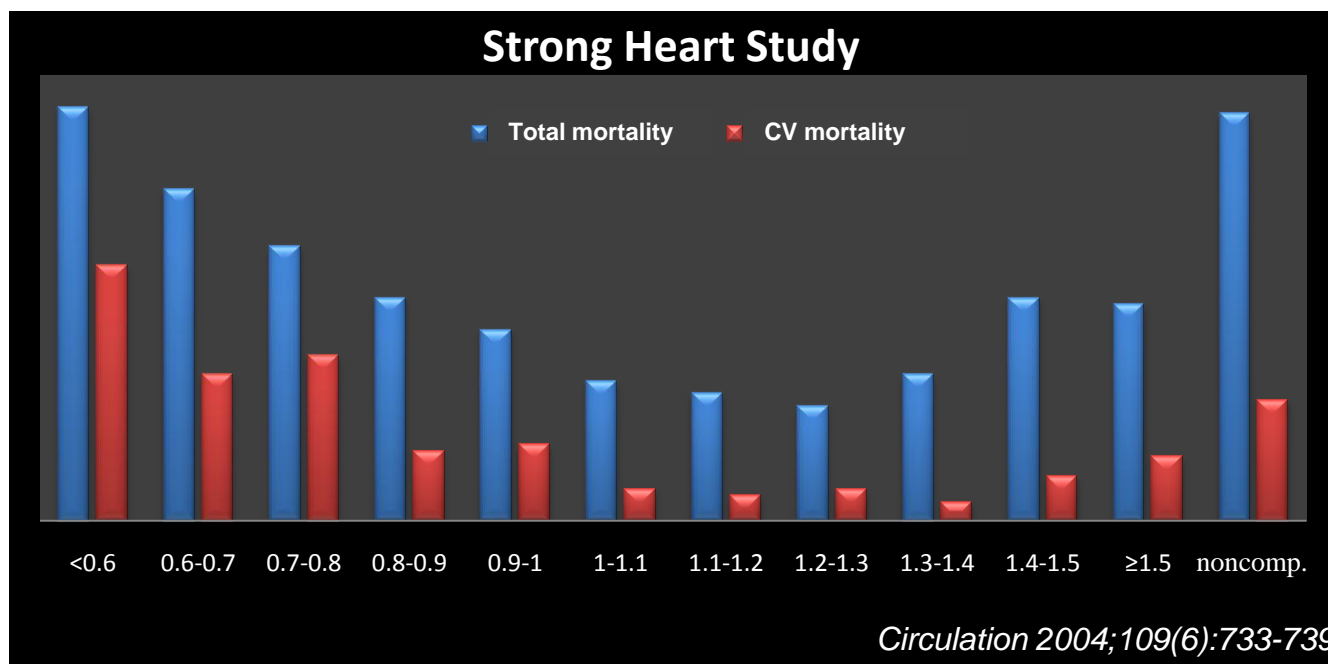

Heald CL, Atherosclerosis 2006; 189, 61-69

Fowkes, JAMA 2008: ABI improves the accuracy of CV risk prediction beyond the FRS

# High ABI

- Most epidemiological studies excluded individuals with high ABI

- **Cardiovascular risk study:** high ABI was associated with 27% ↑ risk of total and 76% ↑ risk of CV mortality vs normal ABI
- **Atherosclerosis Risk in Community (ARIC)**  
no difference in 12-year CV morbidity rate between high and normal ABI groups

# High ABI

---

- **Atherosclerosis and high ABI**

PAD is highly prevalent in subjects with high ABI

Aboyans J Vasc Surg 2008

- Is increased CV risk of high ABI individuals caused by co-existing atherosclerosis?

# Hypothesis

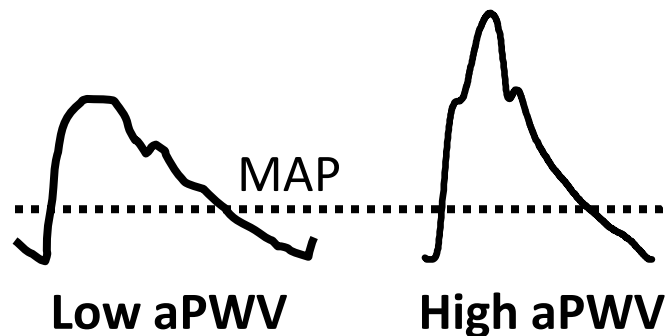

In individuals with high ABI not only muscular arterial stiffness is increased, but also aortic stiffness.

Increased aortic stiffness in individuals with high ABI could be responsible for increased LV mass and increased mortality.

*Medial arterial calcifications*

# aPWV

- Parameter of aortic stiffness
- Independent predictive factor for all-cause and CV morbidity and mortality
- Increased aPWV:

# Aim

---

To compare CV risk profile and aortic pulse wave velocity (aPWV) in individuals with

- low (ABI < 1.0)
- normal (ABI 1.0-1.4)
- high ABI (ABI > 1.4)

in a random population sample

# Methods

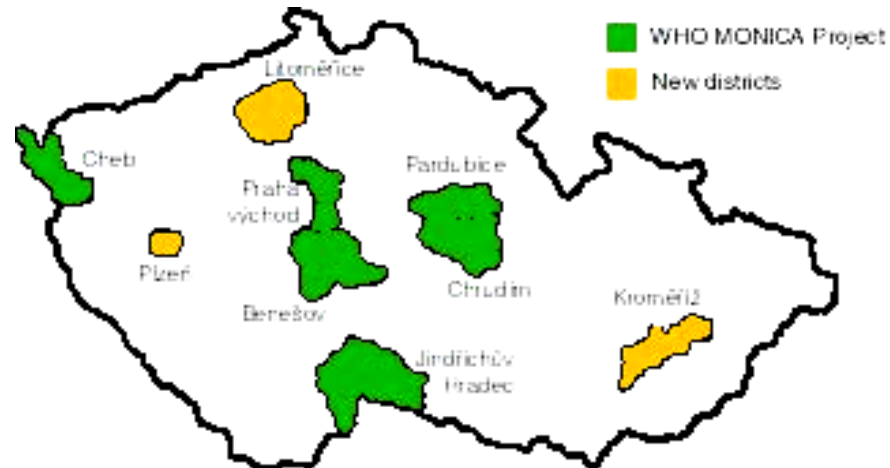

## Population-Czech post-MONICA

**MONICA: MONI**toring of trends and determinants in **CA**rdiovascular disease

- 32 centres, 21 countries

Czech post-MONICA: 2006-2009

- 1% random population sample in 9 districts
- history, BP, echo, ABI, PWV, biochemistry + genetics

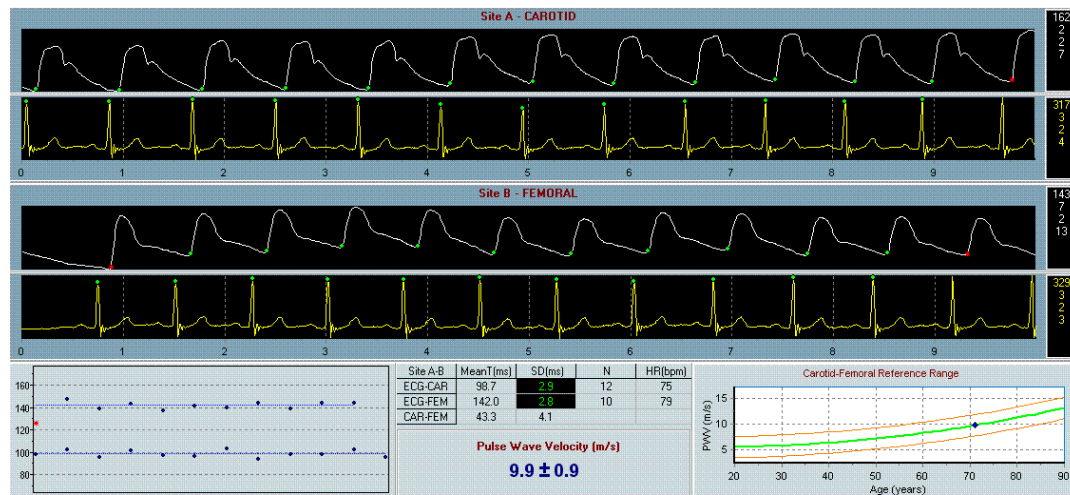

# Methods

**post-MONICA:** 911 individuals from Pilsen district

**ABI** - Doppler (Dopplex multiTM, Huntleigh) with 8MHz probe and mercury sphygmomanometer (Baumanometer TM, W.A.Baum)

**aPWV**- Sphygmocor (AtCor Medical Ltd, Australia)

# Population characteristics I

	Low ABI	Normal ABI	High ABI
Age (years)	63.29±9.24***	53.45±13.54	62.74±7.82**
Cholesterol (mmol/l)	4.99±1.0	5.17±1.02	5.03±0.99

# Aortic PWV by ABI groups

# Adj. aortic PWV by ABI groups

adjusted for age, sex, systolic, diastolic, mean blood pressure and examiner

# Parameters independently associated with high ABI in logistic regression analysis

	B	OR (95%CI)	S.E.	Wald	p
Glucose level	0.33	1.39 (1.05-1.86)	0.14	5.45	0.02
aPWV (m/s)	0.31	1.36 (1.16-1.64)	0.09	12.29	0.001
Sex (male)	-2.02	7.52 (1.76-36.9)	0.77	6.87	0.009
DVT	1.61	0.20 (0.05-0.77)	0.70	5.25	0.022
Age (years)	0.55	1.73 (0.78-3.82)	0.41	1.82	0.18
Weight (cm)	0.32	1.38 (0.48-3.98)	0.54	0.35	0.55
Waist (cm)	-0.07	0.94 (0.29-3.02)	0.6	0.01	0.91
Systolic BP (mmHg)	0.04	1.18 (0.79-1.76)	0.2	0.68	0.41

$r^2 = 0.2$ ,  $p < 0.001$ , DVT - history of deep venous thrombosis, S.E. - standard error

# Conclusion I

---

- In a random population sample, the prevalence of high ABI (2.8%) was similar to the prevalence of low ABI (3.1%)
- Individuals with high ABI had a higher prevalence of hypertension, diabetes and obesity compared with normal ABI individuals
- 26% of patients with high ABI had diabetes

# Conclusion II

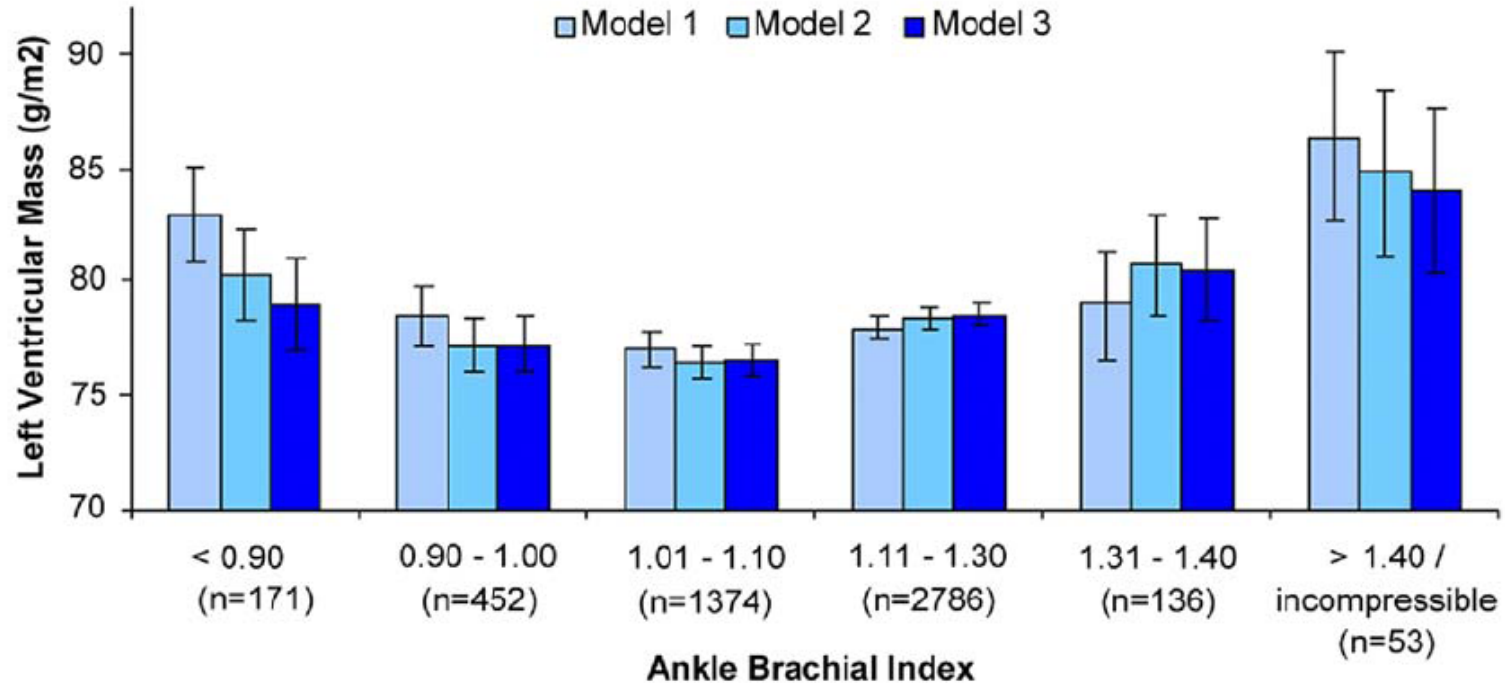

---

- We have shown, for the first time, increased aPWV in individuals with high ABI that was similar to individuals with low ABI
- Worst CV risk profile and increased aPWV point to increased CV risk of individuals with high ABI
