Inflammation in Heart Failure

Denise Hilfiker

Kardiologie & Angiologie

MHH, Hannover

Germany

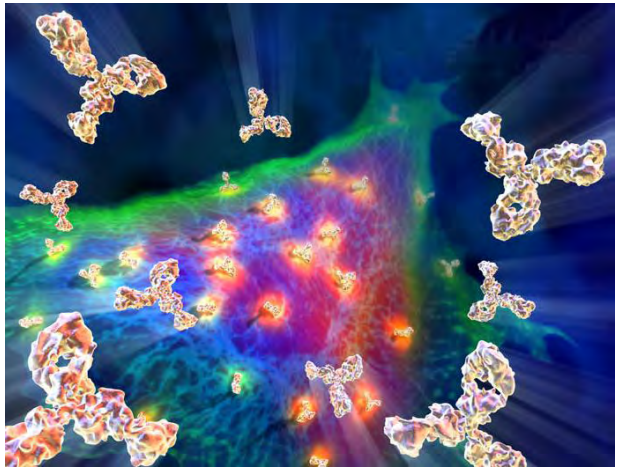
Inflammatory diseases of the heart involve inflammation of the heart muscle and/or the tissue surrounding it.

Myocarditis - inflammation of the myocardium, the muscular part of the heart.

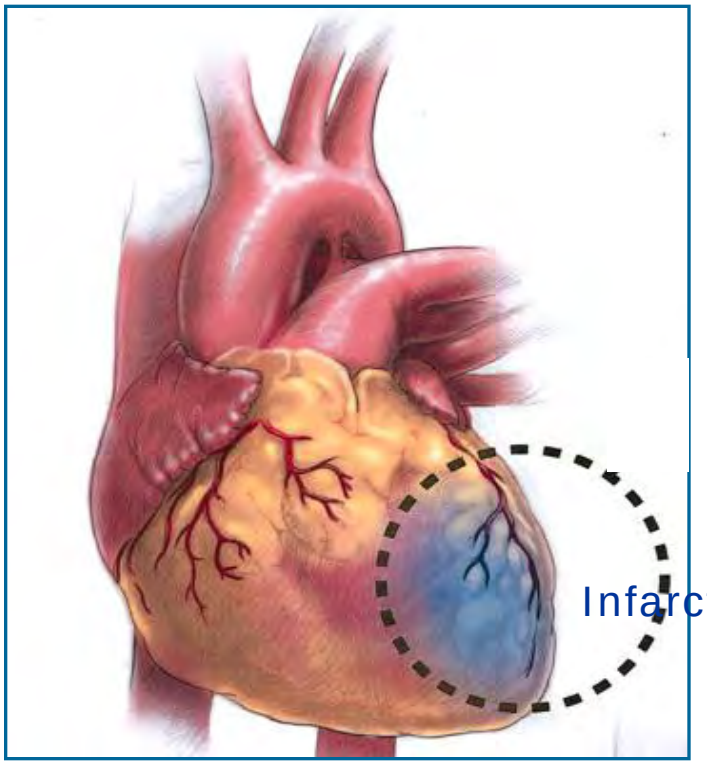
Ischemic heart disease - myocardial infarction.

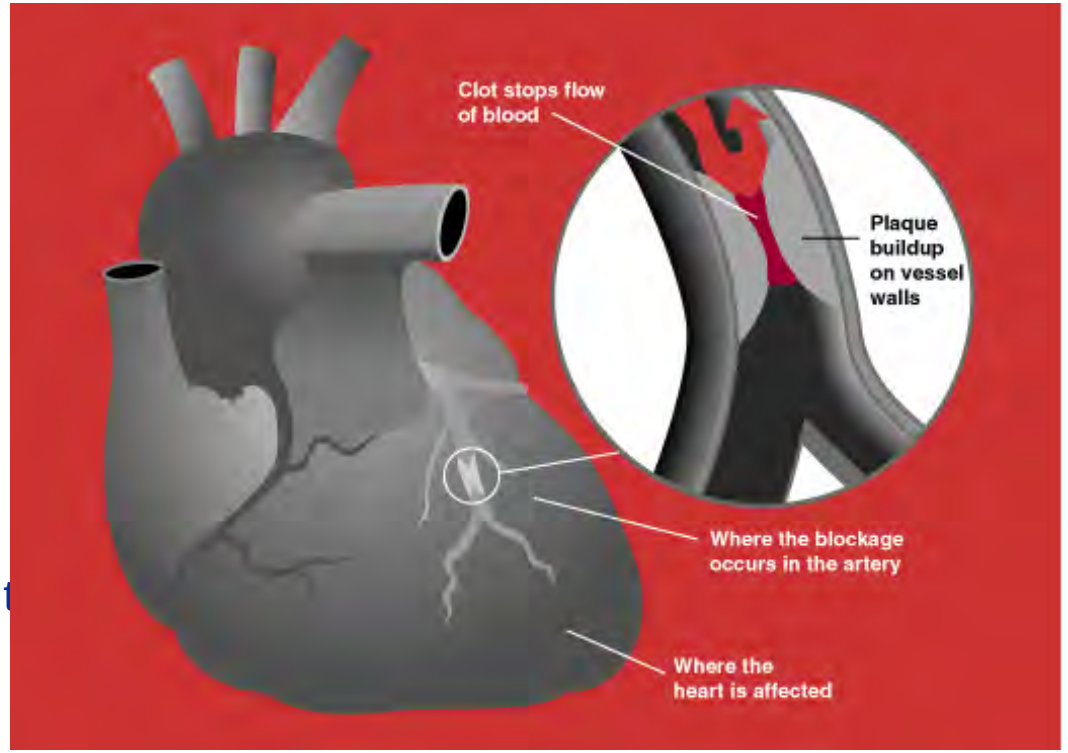
Endocarditis - inflammation of the inner layer of the heart, the endocardium. The most common structures involved are the heart valves.

Acute pericarditis is an inflammation of the sac surrounding the heart --- the pericardium.



Myocardial infarction and ischemic cardiomyopathy





blockade of a coronary artery

loss of cardiac muscle (necrosis, apoptosis

Inflammation

hypertrophy

fibrosis

Advances in interventional therapies have led to a significant decline in mortality during the acute phase of MI, especially in patients with large MI.

Unfortunately this decrease in mortality is paralleled by an increase in the incidence of heart failure in patients surviving with significant residual myocardial damage.

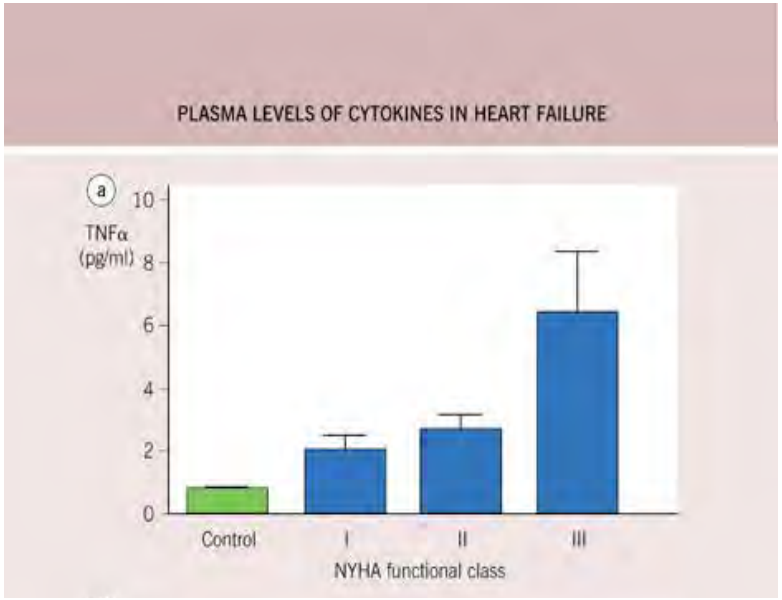
Blocking inflammation after MI?

Failed!

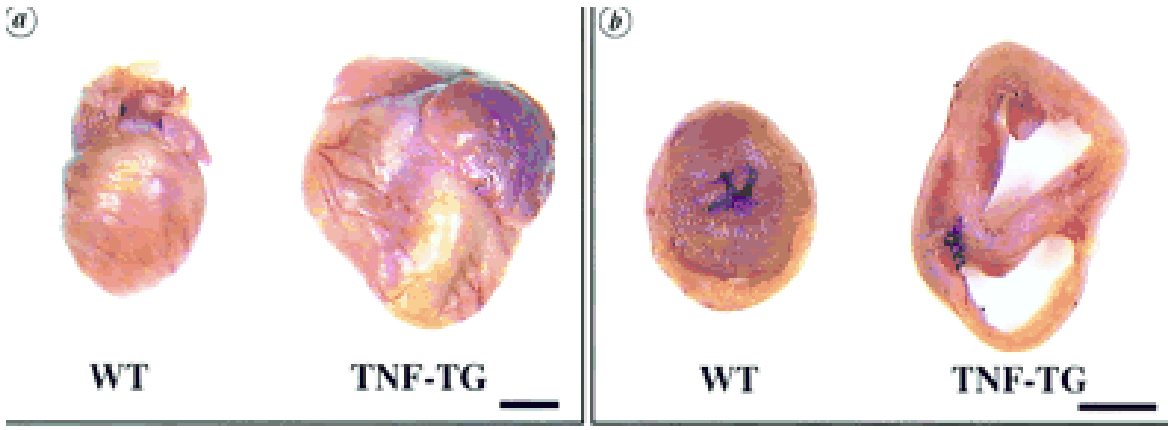
Roberts R, DeMello V, Sobel BE. *Circulation. 1976*
Deleterious effects of methylprednisolone (steroid therapy) in patients with myocardial infarction.

Enhanced expression of cardiac and systemic expression of the pro-inflammatory cytokines for example TNF-α



- **TNF-α-serum levels increase in patients with severity of the heart failure**
- **Mechanical unloading improves cardiac function and reduces TNF-α serum levels**

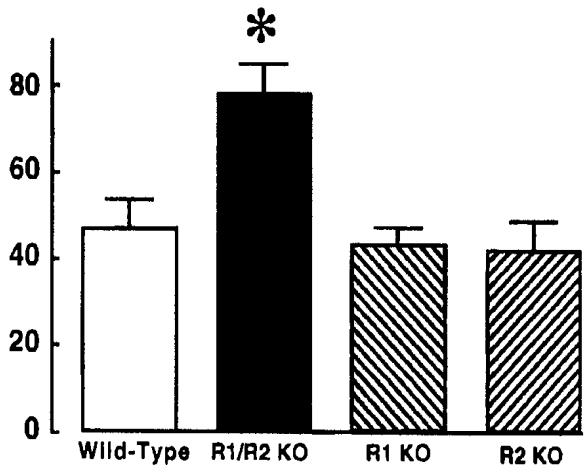
Cardiac failure in transgenic mice with myocardial expression of TNF-α



Magnetic Resonance Imaging (MRI) and invasive evaluation of development of Heart Failure in transgenic mice with myocardial expression of TNF-α. Bryant et al, Circulation 1998

Serial MRI studies in the TNF-α mouse model demonstrate that the rate of progression and severity of LV Dysfunction are dependant on the degree of TNF-α overexpression. Franco et al, Circulation 1999

Endogenous TNF-α protects the heart against ischemic-induced cardiomyocyte death in a mouse model of acute mycardial infarction

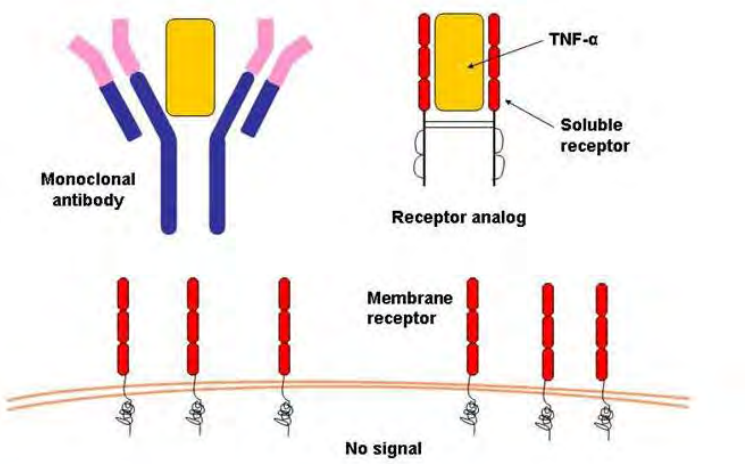


Double knockout of the two TNF-α receptors leads to increased infarct size in acute infarction.

Kurrelmeyer et al. PNAS 2000

Therapeutic approach to neutralize TNF-α

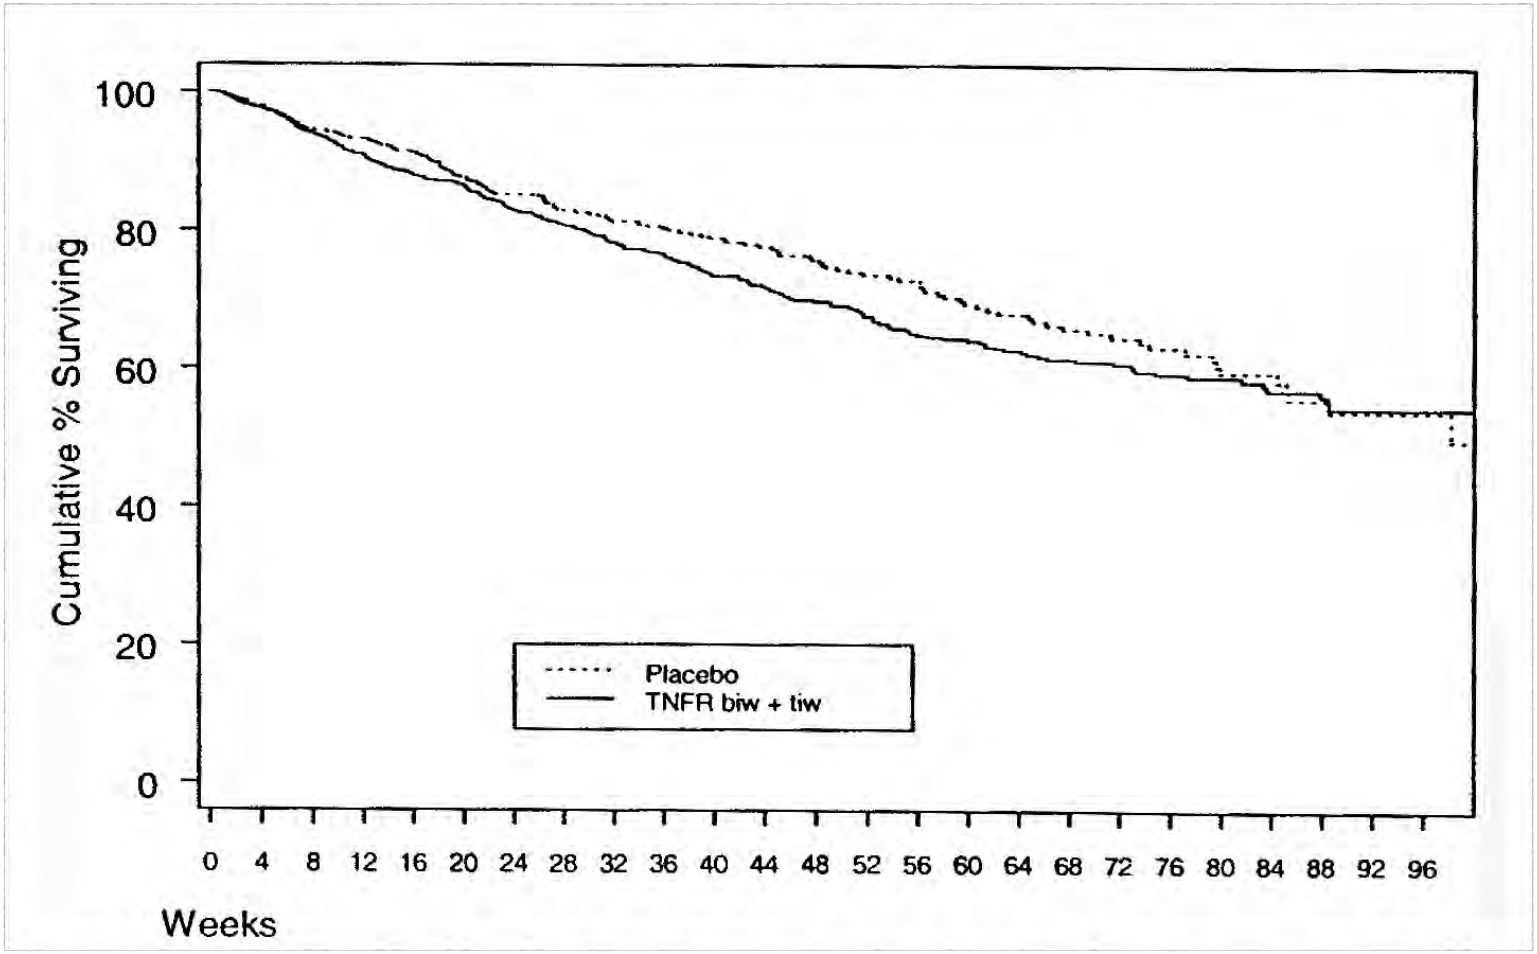
Mechanism of action of TNF-α antagonists. The monoclonal antibody (**infliximab, adalimumab**) and the receptor analog (**etanercept**) bind to circulating TNF-α and block its interaction with membrane receptor.



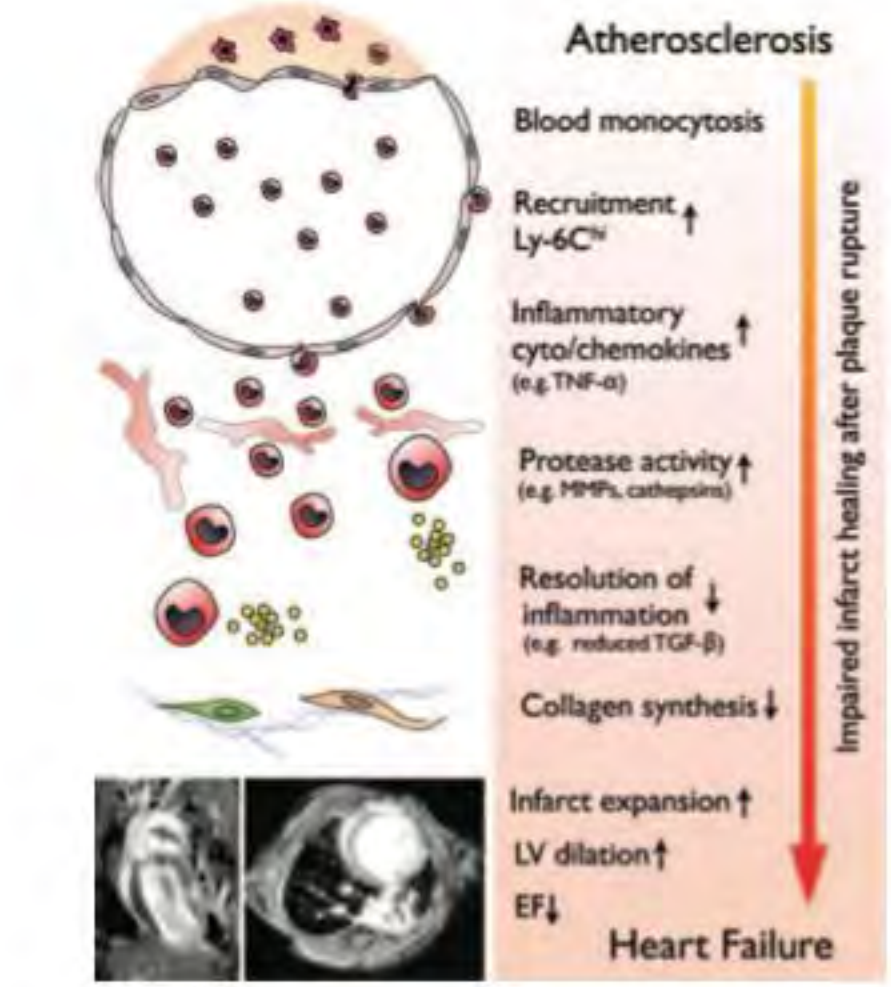
Experimental studies in animals and in small patient collectives were promising.

Randomized multi-center studies?

RENEWAL
All-cause Mortality and CHF Hospitalisations was not lowered by neutralizing TNF-α



Check points involved in impaired healing after myocardial infarction



Nahrendorf et al. Circulation 2010

Development of monocytes, macrophages and dendritic cells
Geissmann et al. Science 2010

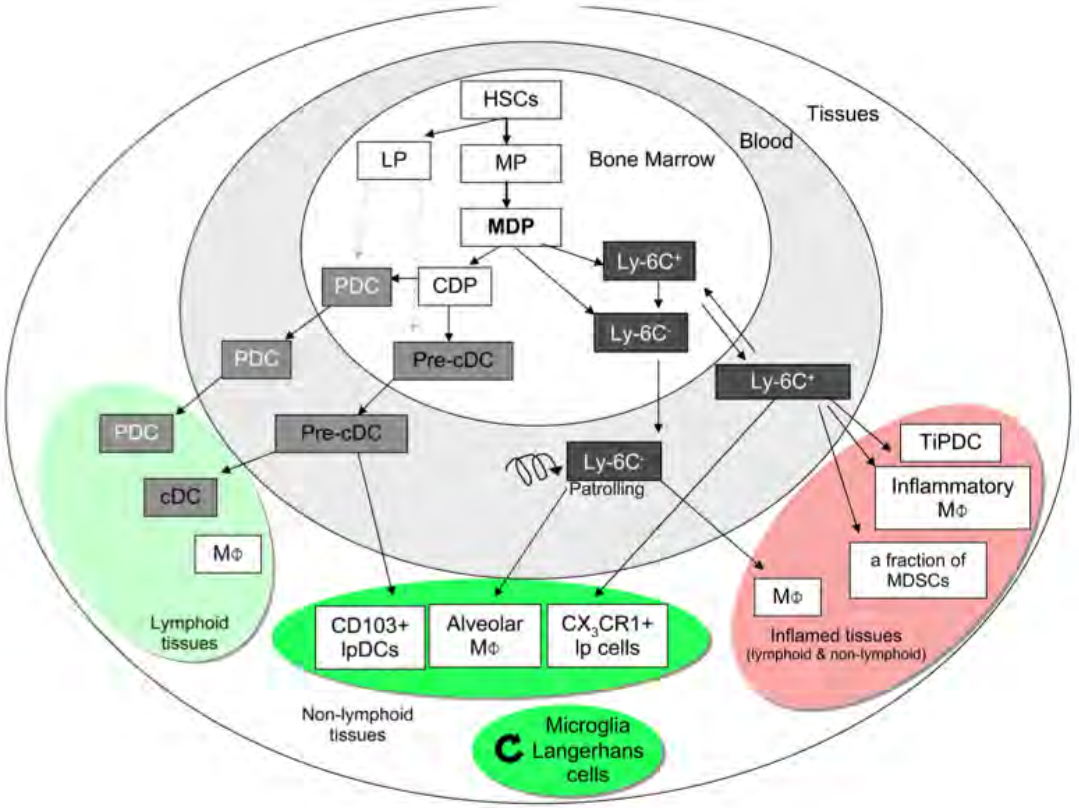


Fig. 2.
Differentiation of DCs and macrophages in mice. In the bone marrow, hematopoietic stem cells (HSC) produce myeloid (MP) and lymphoid (LP) committed precursors. MP give rise to monocyte/macrophages and DC precursors (MDP). MDP give rise to monocytes, and to common DC precursor (CDP). Two monocyte subsets, Ly-6C$^+$ and Ly-6C$^-$ leave the bone marrow to enter the blood. CDP give rise to pre-classical dendritic cells (pre-cDC) and plasmacytoid dendritic cells (PDC). Pre-cDC circulate in blood and enter lymphoid tissue, where they give rise to CD8α$^+$ and CD8α$^-$ cDCs, and non-lymphoid tissues, where they may give rise to CD103$^+$ lamina propria DC (lpDC). Under homeostatic conditions, Ly-6C$^-$ monocytes may contribute to alveolar macrophages (MΦ) and Ly-6C$^+$ monocytes can become CX_3CR1^+ lpDCs in non-lymphoid tissues. During inflammation, Ly-6C$^+$ monocytes give rise to monocyte-derived DCs, e.g. TNF and iNOS-producing dendritic cells (TipDC), inflammatory macrophages, and may contribute to myeloid-derived suppressor cells (MDSC) associated with tumors. They are also suspected to contribute to microglia and Langerhans cells in selected experimental conditions. Microglia and Langerhans cells can renew independently from the bone marrow (curved arrow). HSC can also leave their bone marrow niche and enter peripheral tissues, where they differentiate to myeloid cells during inflammation. It is unclear at this time if LP contribute significantly to PDC and cDCs (dashed arrow).

Nahrendorf et al. Circulation 2010

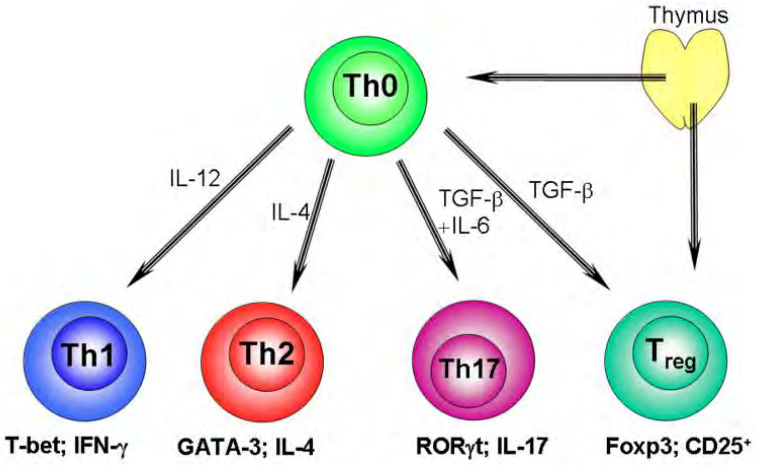
Macrophages and subsequent release of cytokines are important for:
clearing dead cells
promote angiogenesis
Induce fibroblast proliferation

SR-A modulates the activity of marcrophages at the site of inflammation.

Are there subtypes of inflammatory cells, that may serve as modulators of inflammation?

The immune system has developed mechanisms for tolerance to prevent allergy; autoimmunity etc. for which regulatory T cells (Treg) play an important role

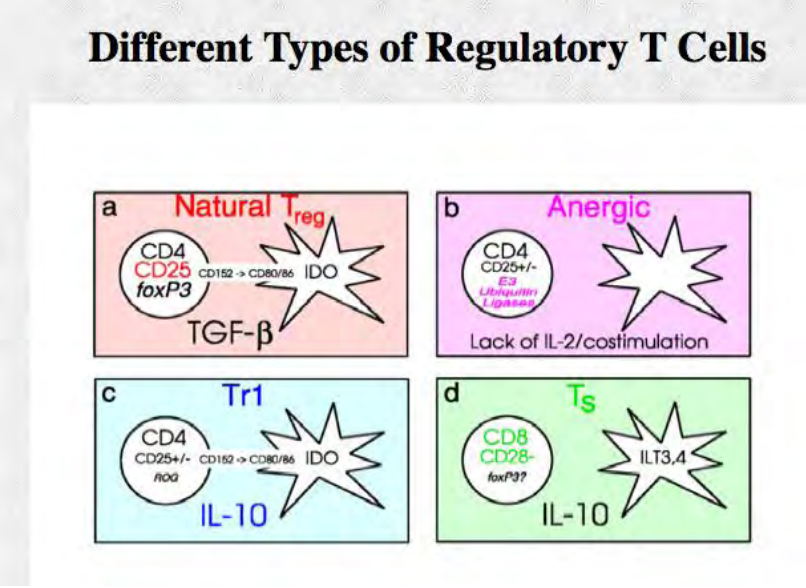


Regulatory T cells (**Treg**, sometimes known as suppressor T cells) are a specialized subpopulation of T cells **suppress activation of the immune system** and thereby maintaining immune system homeostasis and tolerance to self-antigens.

Treg suppress immune responses of other cells, an important **"self-check"** built into the immune system to prevent excessive reactions.

CD8+ **Treg**, CD4, CD25, and Foxp3 **Treg**; and other T cell types that have suppressive function.

All T cells come from progenitor cells from the bone marrow, which become committed to their lineage in the thymus.



CCR5+ foxp3+ Tregs is a CD4+ lymphocyte subset with potent anti-inflammatory properties.

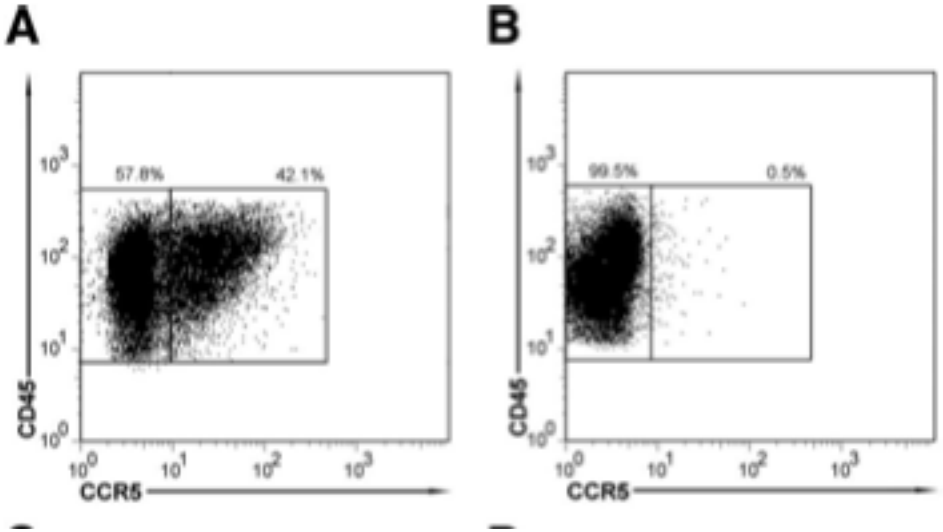
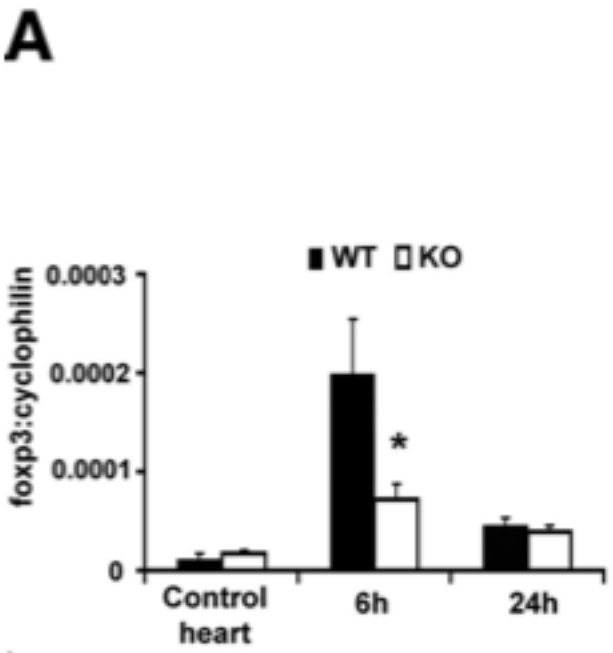
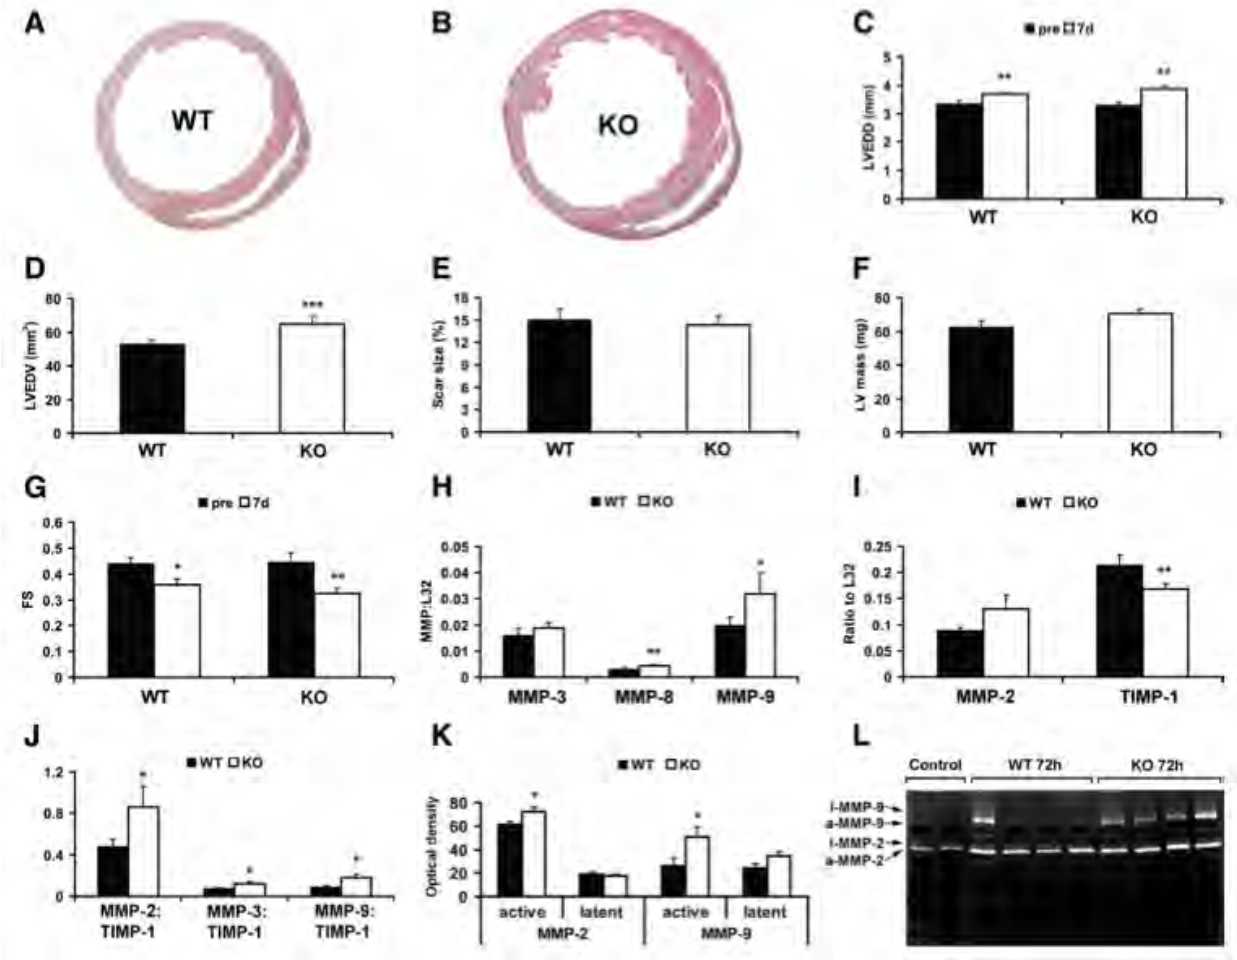
Lack of CCR5 positive inflammatory cells reduces invasion of T-regulatory cells (Tregs) into the infarcted heart





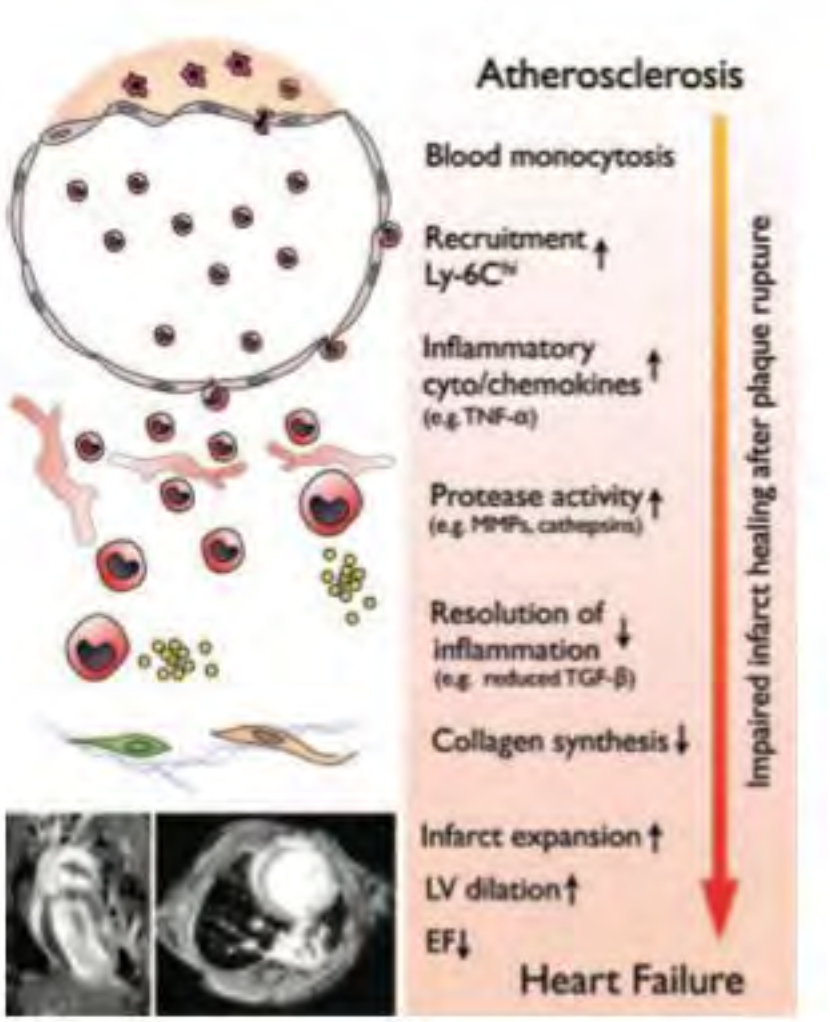
Dobaczewski et al. American Journal of Pathology 2010

Lack of anti-inflammatory Tregs enhances MMP activity and leads to dilatation and dysfunction of the infarcted heart



Dobaczewski et al. American Journal of Pathology 2010

Check points involved in impaired healing after myocardial infarction



Nahrendorf et al. Circulation 2010

Macrophages and subsequent release of cytokines are important for:
clearing dead cells
promote angiogenesis
Induce fibroblast proliferation

SR-A modulates the activity of marcrophages at the site of inflammation.

Tregs seem to play are role in modulating of post infarct inflammation.

What is the impact of the kinetic of post infarct inflammatory processes and how is it regulated?

The timely regulation of inflammatory processes following infarctions seems a key event for healing versus adverse remodeling

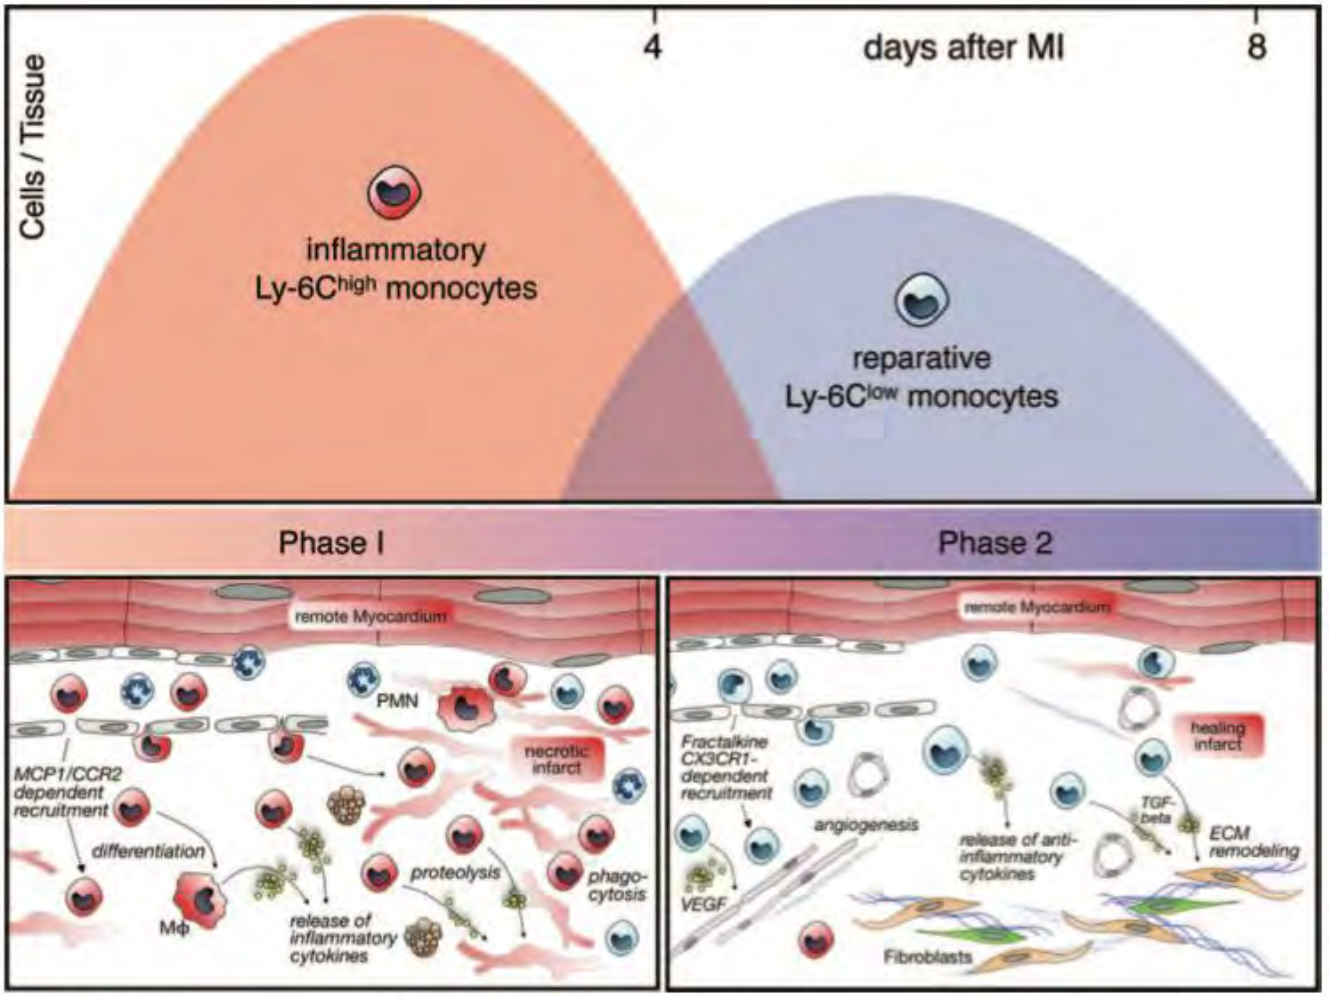


Figure 2. Biphasic monocyte response after myocardial infarction in the mouse. Time course of monocyte subset recruitment and their function depicted in the lower panel are adapted from Nahrendorf et al.[30] PMN indicates polymorphonuclear neutrophil; MΦ, macrophage; and ECM, extracellular matrix.
